

Internet Speed from the router drops intermittently. What could be the reasons?**Solution:**

1. There could be a number of reasons for internet speed drop. To identify the exact issue please try the following:
2. Check internet speed received using tools like ww.speedtest.net
3. Check the difference of speed received through the router with regards to the ISP plan
4. Check whether the issue is noticed on single or multiple devices
5. Check if the speed drops only on wired clients or wireless clients as well
6. Test and note the internet speed on wired as well as wireless clients
7. Check if the internet connection is stable from the ISP end
8. If observed only on wired clients, try different or shorter lan cable
9. If observed only on wireless clients then check for any wireless interference near the router
10. Try to reset and reconfigure the device

If issue persists, please speak to a live technician on 1800-209-3444.
